

LC 48 Rotate Image

Approach:

- Kadane Transpose the matrix by creating a temp variable and swap the `matrix[i][j]` with `matrix[j][i]`
- Then reverse the each row of matrix

LC 56 Merge Intervals

Approach:

- Sort the intervals by the starting time i.e., the `x[0]` in the `[start,end]` interval to understand the ordering of the intervals taking place
- Iterate the sorted list,
 - If the current interval overlaps with the previous one, merge them both by extending the end time
 - Else add the current interval as the new one
- Return the merged list

LC 88 Merge sorted array

Approach:

- Create three pointer , one pointing towards the last valid number in array 1, one pointing to the last element of array 2 and one pointing to the entirety of array 1
- Compare the current largest numbers in both arrays and put the bigger element at the end of the array. Move pointers accordingly
- If anything left in second array, copy them into the first array
- No need to handle leftover elements of first array as they are already in place
